from the because because the numerator is of a higher degree than the denominator. To find a slant asymptote, we divide the factors which did not cancel and consider the quotient. We can disregard the remainder, so there is no need to do fully long devision here. We are left with a slant asymptote of . Find the vertical asymptote of the function Possible Answers: Correct answer: Explanation: Vertical asymptotes occur when the function values increase without bound as the input approaches a certain value. In other words for some value of x, which is the line describing the vertical asymptote. Now, anytime a denominator is 0, the value of a fraction or rational function is undefined. This is where . The denominator in this function is So, solve for x in To get . Find the oblique, or slant asymptote of . Possible Answers: Correct answer: Explanation: When the degree of the numerator is greater than the degree of the denominator by a factor of 1, then a function will have an oblique asymptote. The numerator increases faster than the numerator by a factor of x, so there will be a line with a slope that the graph will approach but not intersect. The asymptote can be found by performing polynomial or synthetic division, and ignoring the remainder. Synthetic division of gives 3_| 2 4 3 6 30 _______ 2 10 |_33 The quotient witout the remainder is the asymptote . Determine the vertical asymptotes of the following equation: Possible Answers: There are no vertical asymptotes Correct answer: Explanation: First, start by isolating x and y on seperate sides to get the equation into the form of y=x. Do this by adding 4x to both sides. Next, factor out a y on the right side Divide both sides by to get in the for of y=x Now that the equation is in the y=x form, we can set the denominator equal to 0 and solve for x Find the horizontal asymptote of . Possible Answers: Correct answer: Explanation: A horizontal asymptote occurs when y approaches a certain value as x goes to infinity or negative infinity. in a rational expression when the degrees of the numerator and denominator are the same. The independent variable of both terms increases or decreases at the same rate, while the terms themselves change according to their leading coefficients. This is to say that there is a line defined by the ratio of leading coefficients that the graph will approach but not inetrsect as x increases or decreases indefinely. The leading coeffiecint of the numerator is 3, while the leading coefficient of the denominator is 2. So the asymptote is the line . What is the horizontal asymptote for the function below? Possible Answers: Correct answer: Explanation: Since the leading terms of the numerator and the denominator have the same degree, the ratio will move towards a constant. The ratio of the leading coefficients is 1/1, so the function will taper off to y = 1 in both the positive and negative directions for x. Given the equation , determine the horizontal asymptote. Possible Answers: Correct answer: Explanation: Change the equation into the y=x form. When the degree of the exponent in the numerator is higher than the degree of the exponent in the denominator, there is no horizontal asymptote. Thus the answer is no horizontal asymptote. At what value(s) of are the vertical asymptote(s) of the function located? Possible Answers: Correct answer: Explanation: Asymptotes can occur where the function is undefined, or when the denominator is equal to . Simplfying our function gives us, . Now solving for when our denominator is zero gives us, Therefore, there is a vertical asymptote at ¢ÃÂÂ Previous 1 2 3 4 5 6 Next ¢ÃÂÂ Reza Certified Tutor University of Manitoba, Doctor of Philosophy, Mathematics.
